Build a platform where users can list, search, and book real estate properties for rent or sale.

Key Features:

User Roles:

- **Job Seekers**: Users looking for jobs can search and apply.
- **Employers**: Can create, edit, and delete jobs. Can also shortlist or reject candidates.

Employer Features:

- **CRUD Operations for Jobs**: Employers can create, read, update, and delete job listings. The listings include job title, description, location, category, and job type.
- **Candidate Management**: Employers can view a list of candidates for each job and mark candidates as shortlisted or rejected.

Job Search and Filters:

- **Job Search**: Job seekers can search for jobs by location, category, and job type.
- **Filters**: Filters for narrowing down jobs based on criteria like part-time/full-time, city, or industry type.

Resume Builder for Job Seekers:

- **Personal Information**: Name, contact details, address, and a professional summary.
- **Education**: Degree, institution, graduation year, and any achievements.

* Coding Blocks Web Development Assignment by **Kartik Mathur**

- **Experience**: Previous jobs, roles, responsibilities, and duration.
- **Skills**: A list of relevant skills, certifications, and accomplishments.
- **Portfolio Links**: Links to websites, GitHub, or other professional profiles.

Admin Dashboard:

- **User Management**: Admins can view a list of all job seekers and employers, along with actions to deactivate or delete accounts.
- **Job Posting Analytics**:
  - Total jobs created.
  - Number of applicants.
  - Percentage of jobs filled.
  - Ratio of shortlisted vs rejected candidates.
  - Overview of popular job categories and locations.

You can use your own creativity to add more features too, above are the minimum features that you need to add.

- To store information, use Local Storage.
- Please ensure that it should have good UI.
- You can refer to job portals too.
